

Lead Opportunity — executive decision

- Guarded pilot eligible
- Lead Quality lift@10: 1.69x; combined Opportunity: 1.37x.
- The code gate uses rolling CV and validation; evidence remains retrospective.
- Retain two axes because inventory incremental value is still unproven.

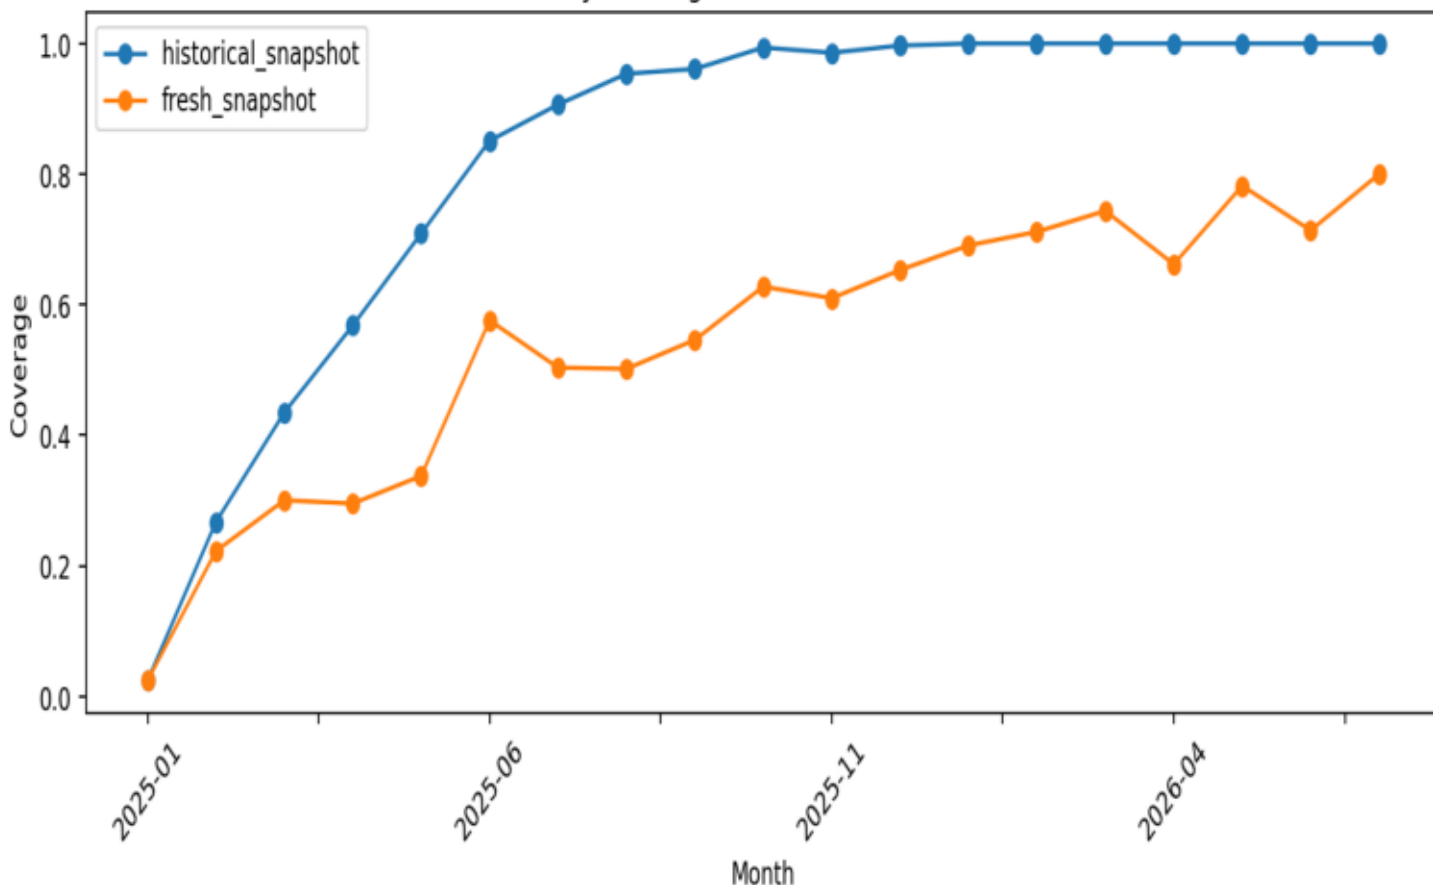

Why the contract is T1

- T0 changes with inquiry exposure.
- T1 scores one lead at first inquiry.
- Recent outcomes remain censored.

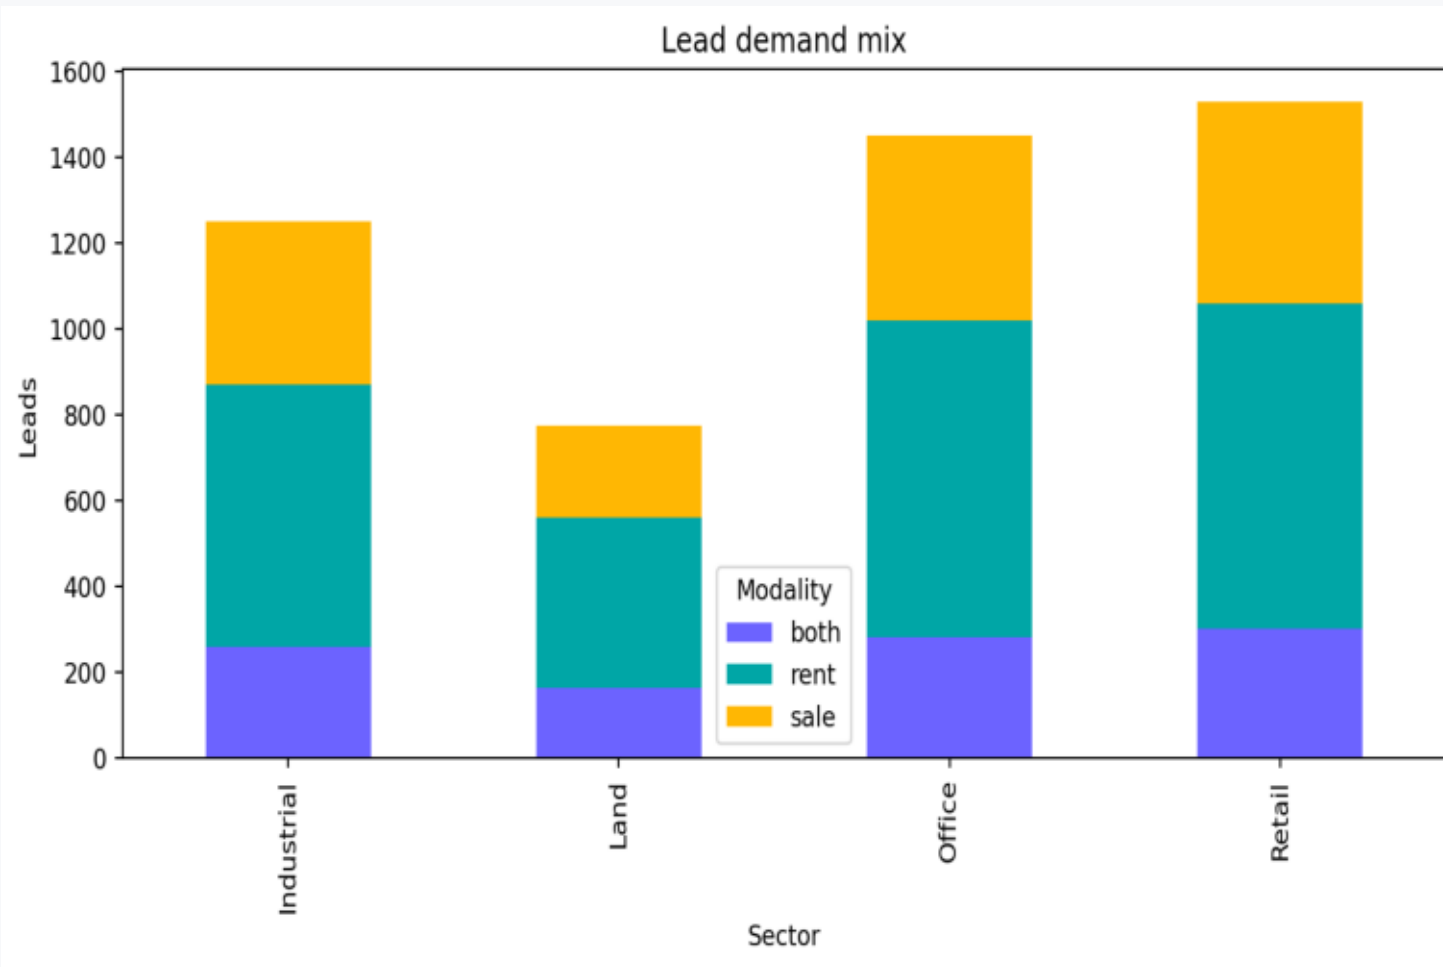

Point-in-time inventory

Availability coverage under strict backward as-of

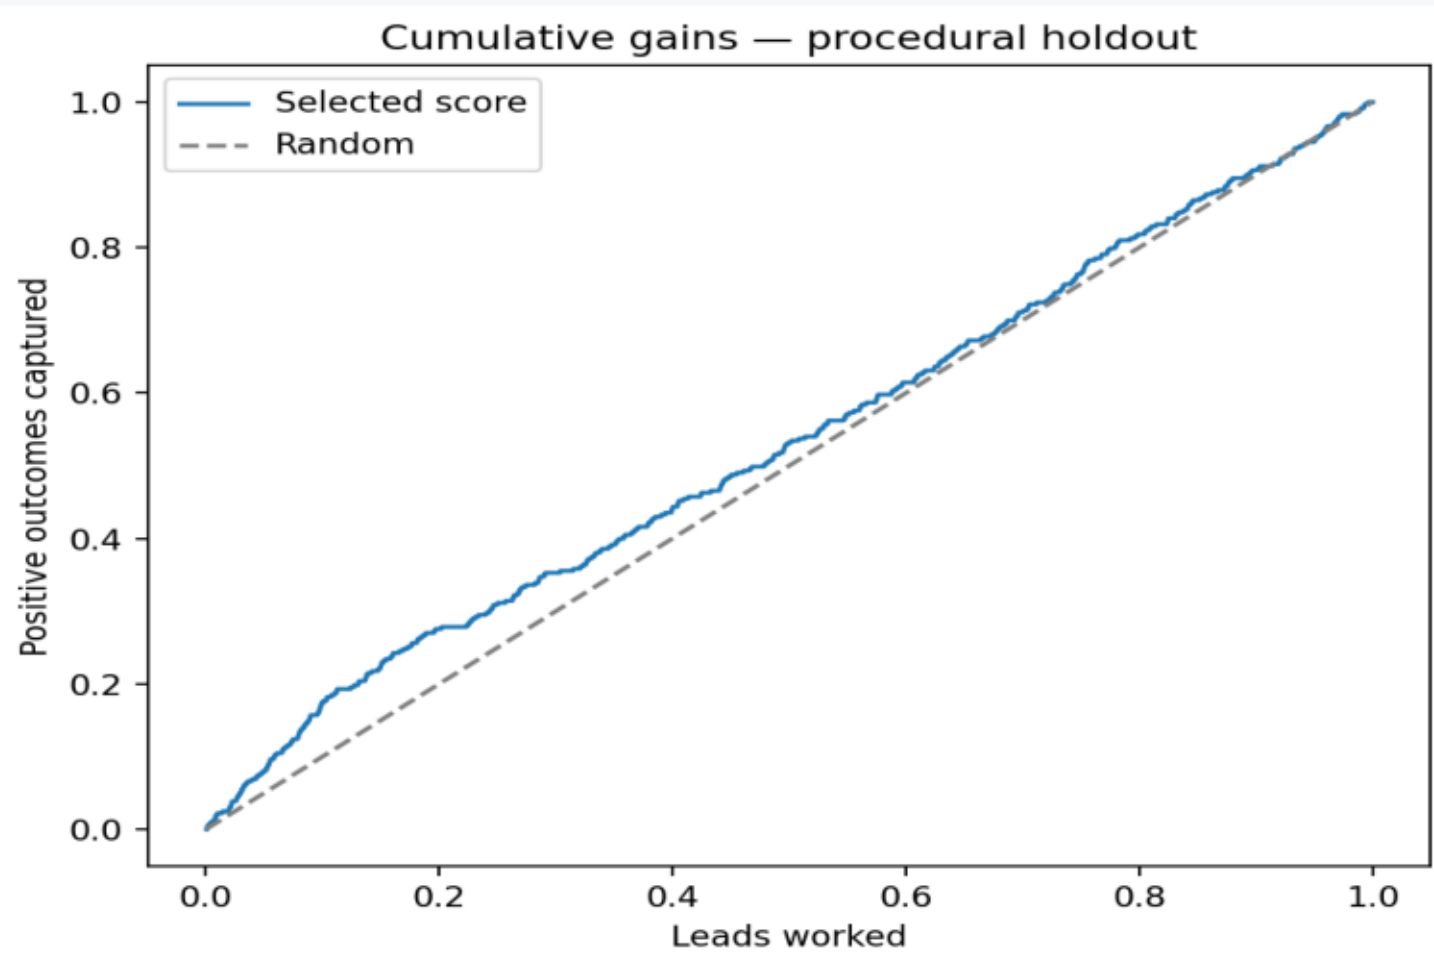

- Backward as-of only.
- Unknown history is not unavailability.
- Listing fields remain conditionally historical.

Demand and data context

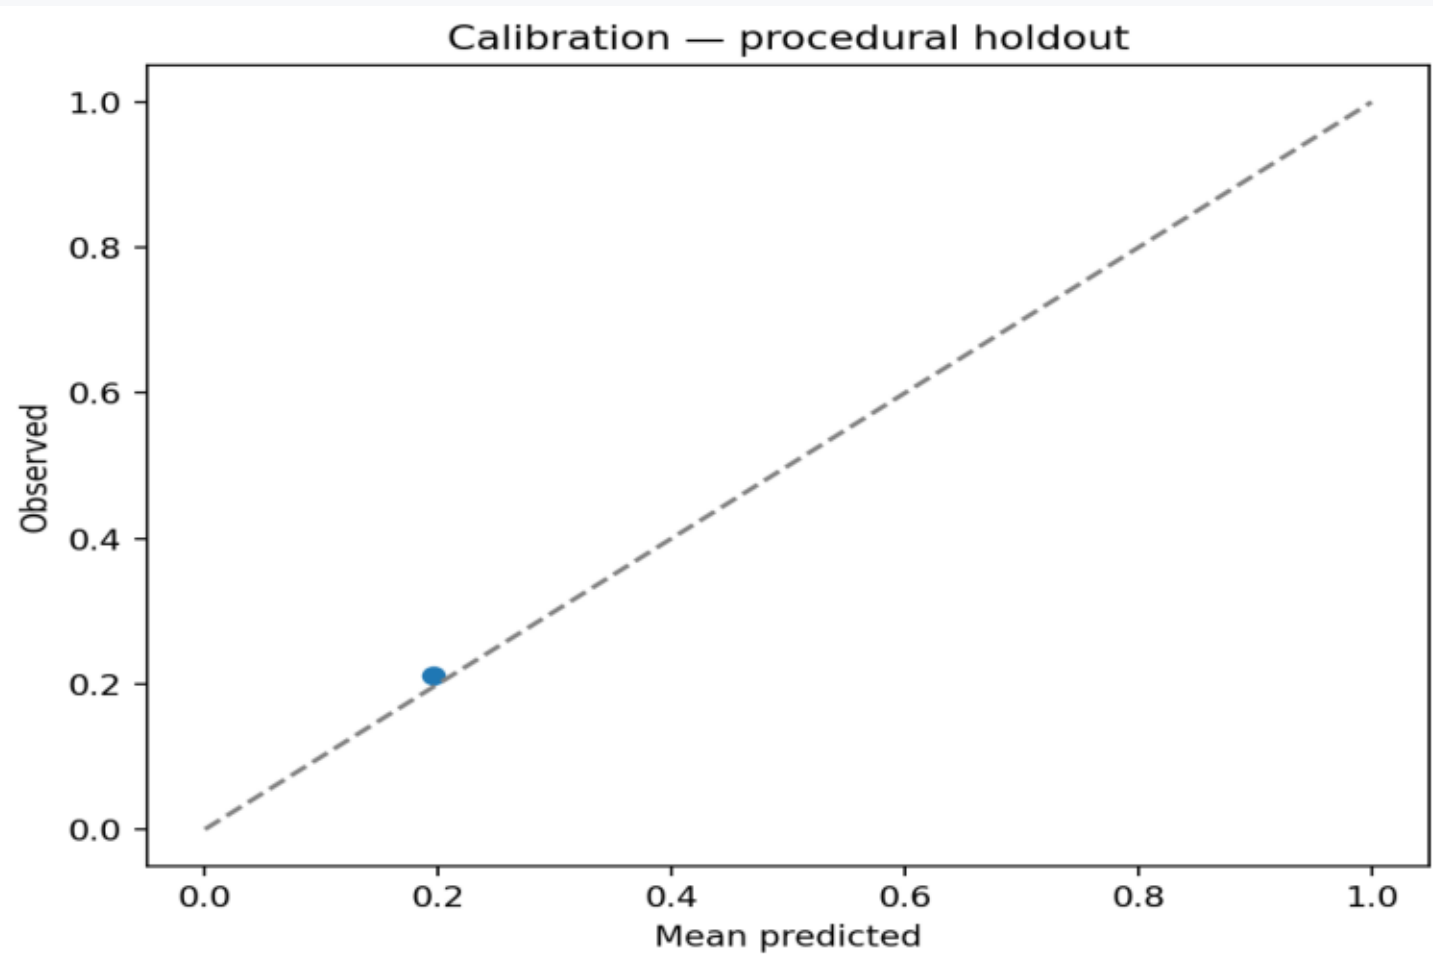

- Mix differs by sector and modality.
- Market context is EDA-only.
- No mutable spot counters enter the model.

Ranking on the procedural holdout

- Top 10% captures 17.0% of positives.
- Lift@10 is 1.69x.
- Bootstrap intervals include random ranking.

Probability calibration

- Brier: 0.166.

- Calibration is assessed against the train-rate baseline.

- Ranking lift and probability calibration are separate gates.

Recommendation and product roadmap

- Run a new forward shadow period before changing lead routing.
- Version listing state and log offer/recommendation exposure.
- Measure scheduled visit and downstream conversion at 30 days.
- LLM semantic QA: controlled synthetic test complete; natural review pending; keep it outside historical scoring.
- Then run a guarded randomized pilot with downstream outcomes.
